

Our Differentiator.

Cloud Business Solutions - Aggregation & Analytics

Many retailers with multiple POS devices don't have the ability to see one view of transactions. We solve that challenge with our Aggregation & Analytics product.

Aggregation provides the ability to centralize terminal transaction data and integrate into Quick Books or other accounting packages. And whether it is a local or remote device, merchants are working with a single interface.

A cloud-based terminal connection allows for all devices to seamlessly connect to the register with a simple Web service.

Our solution will connect through LAN, WiFi and Cellular connections. This flexibility allows for easier install at the merchant locations. POS devices can be positioned in more convenient locations without the need to be tethered to the register.

Merchants also benefit from trend analysis to have a better view of customer spending patterns. Our cost-effective aggregation and analytics tools allows for better decision-making to reduce expenses and increase profits.

How it Works for You

Our Differentiator.

Cloud Business Solutions - Aggregation & Analytics

Batch Aggregation

With Batch Aggregation, collecting data has never been easier. Merchants with multiple devices, including devices in the field, receive transaction data and a PCI compliant report for all devices.

Accounting Tool Export

Use this service to gather and import transaction data. This tool provides multiple interfaces to programs such as Quick Books.

Transaction Analytics

With this tool, you have access to actionable insights. Make more informed decisions with analytics on the types of transactions, dollar amounts and register location comparisons.

Charge Back Management

Merchants can utilize a Charge Back System to access required information to dispute a charge.

Device Discovery

Benefit from device data, including the number of times active, transactions processed, connection times and location analysis.
